Practical – 9

Practical 9: Secure User Registration with Database Insert, Duplicate Email Check, and Password Hashing

Implement secure user registration by inserting user details into MySQL using MYSQLi. Validate input on frontend and backend, check duplicate email/username, hash passwords using password_hash(), and display appropriate messages.

Theory :

1. Is password_hash() used before storing passwords?

Yes. The password is hashed using password_hash() before saving it in the database.

2 Is duplicate email/username checked?

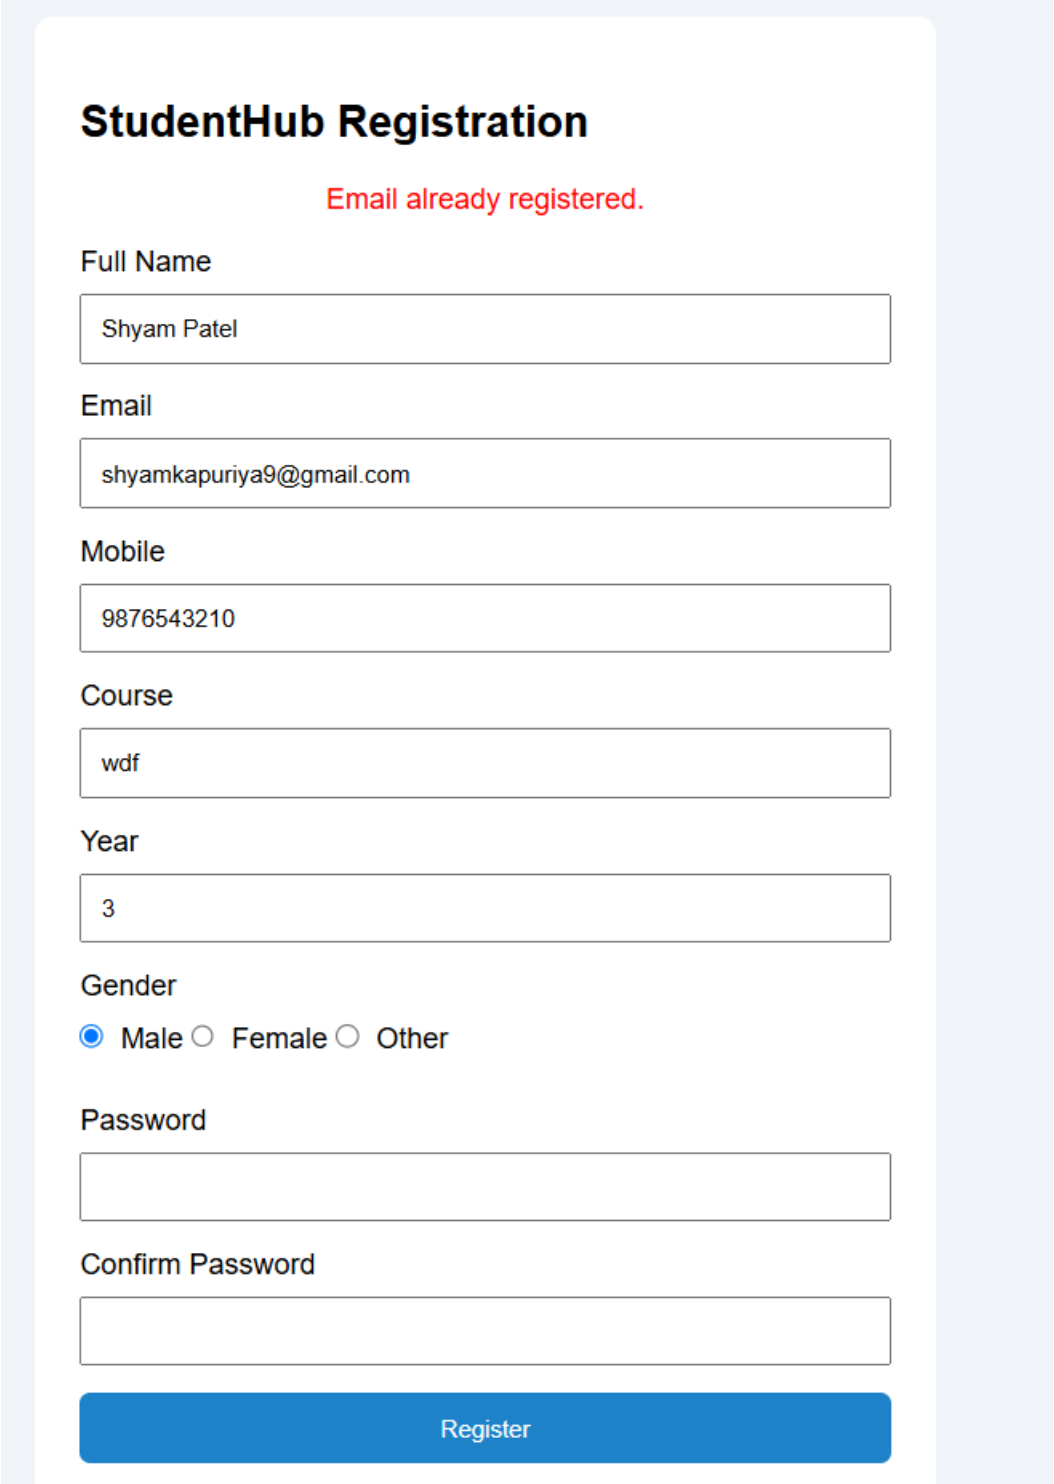

Yes. The system checks whether the email or username already exists before inserting a new user.

3. Are frontend and backend validations consistent?

Yes. The input is checked on both the frontend and backend to make sure valid data is entered.
