

## **Practical 5**

Create a student registration form with HTML5 input types and JavaScript validation for name, email, mobile number, password, confirm password, course, year, gender, and terms acceptance. Use Regular Expression for validations.

### **A. Theory :**

Practical 5 was about creating a student registration form with frontend validation and user-friendly error handling. The main purpose was to make sure that the information entered by the user is correct before accepting the form. The registration form includes fields such as full name, email address, mobile number, password, confirm password, course, year, gender and terms and conditions. JavaScript and Regular Expressions are used to validate the entered information. The practical also focuses on displaying clear error messages near the field where the user has made a mistake. Password strength checking and real-time validation are also included so that the user receives feedback while entering information.

### **B. Implementation/ Output/Result :**

I implemented a student registration form with frontend validation. The form validates name, email, mobile number, password, confirm password, course, year, gender and Terms and Conditions. Regular Expressions are used for input validation, and password strength is displayed while typing. Appropriate error messages are shown near invalid fields, and a successful registration message is displayed when all information is valid.

**E. Challenges Faced:**

The main challenges were creating the correct Regular Expressions, especially for password validation, implementing password-strength checking and performing real-time validation. I also faced difficulty in handling different form elements such as radio buttons and checkboxes and displaying separate error messages for each field.

**F. Learning Outcomes:**

I learned how to create and validate forms using HTML, CSS and JavaScript. I understood Regular Expressions, frontend validation, password strength checking, confirm-password validation and real-time error handling. I also learned how to make form validation more user-friendly by showing clear messages near the incorrect fields.
